

Lawn and Garden Improvement Use of **CONDOR AG** LandLife

Earth Science Products Corp. has manufactured and distributed several different products for over 40 years. In this time, we have attained invaluable knowledge in the use of our products in the heavy clay soils found in all areas of the country including Oklahoma. Here are some “tips” we wish to pass on to you that we feel will help you be more successful in your endeavors.

- The “Condor Effect” is the visible softening and change in friability of the clay. It occurs over time as you treat with the product. After repeated use, the soil will drain better and absorb water readily without swelling. It will not crack as much when it dries out. A more granular friable soil will be noticed.
- For untilled soil, water the existing ground thoroughly before applying Condor AG.
- Water thoroughly again after applying the Condor AG.
- Use the above technique whenever laying sod, before you lay the sod down.
- If the soil has been tilled, treat the tilled soil for more rapid improvement and add the Condor mix very liberally until runoff is observed.
- Remember: 1 gallon of Condor AG to 300-500 gallons of water. If the ground will not absorb the water, apply in smaller amounts, incrementally, until the “Condor Effect” is observed. If using a hose-end sprayer, set it to dilute to 4 oz. per gallon.
- If it seems like a lot of water, it is! That is how it works.
